A: Scatter plot showing the relationship between COM-Q Total Score (higher = more social comfort) and Log theta power during social attention. The plot includes data points for 6-month-olds and 12-month-olds, with linear regression lines for each age group.

B: Scatter plot showing the relationship between SADS Total Score (higher = more social anxiety) and Log theta power during nonsocial attention.

C: Scatter plot showing the relationship between Log theta power during social attention and Log theta power during nonsocial attention.

D: Additional scatter plot with similar data to A and B, showing the relationship between another variable and Log theta power during social and nonsocial attention.
