Figure 82: Conventional and offset vaults

- X lateral thrust
- Y vertical thrust
- Z resultant thrust contained within wall thickness

Resultant thrust **Z** directed close to the external face of the wall. As the height of the structure increases this component is carried beyond the perimeter, and renders the arch unstable. At St. Michel de Sournia the lateral walls of the building vary between 90 cm (S & E), 85 cm (apse) and 80 cm (N & W)
