The authors would like to point out an error figure 8 panel F. This was due to a conversion problem during the editorial stage. The corrected version of the figure is provided below. The authors would like to apologise for any inconvenience caused.

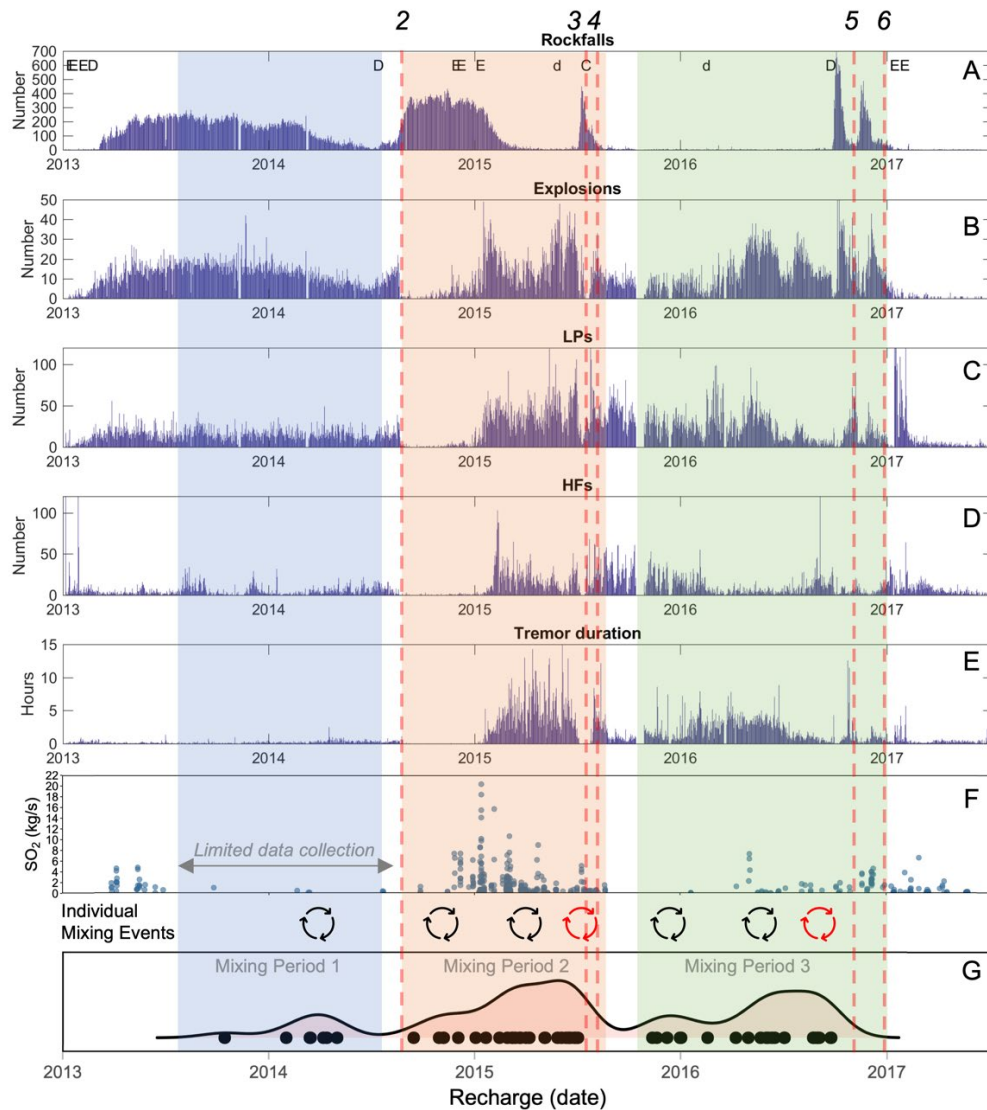

Fig. 8. Seismic (A–E) and gas (F) monitoring data compared to the timeline of mixing events (density curve of all data, G). Coloured transparent boxes as in Fig. 6. Circular arrows above the density plot refer to inferred individual mixing events based on peaks in the density distributions and clusters of data, representing in-dividual mixing events within a broader recharge period, with black circles represent priming injections and red circles representing triggering injections. Red dashed lines represent the start date of the eruption (cf. the red fields in Figs. 6 and 7) with the Eruptive Phase marked as the italicised number on the top of the line. (For interpretation of the references to colour in this figure legend, the reader is referred to the web version of this article.
